Smart Land Use Drives Hazard Mitigation

Mitigation is an interdisciplinary field that uses a wide range of techniques to reduce risk. Land use planning is one of those techniques. Communities employ it to set the stage for development and growth, put building codes into context, and provide useful and effective mitigation tools. As National Community Planning Month approaches, join this CERC webinar as we look at the importance of applying land use solutions to reduce natural hazard risk and hear about one Colorado community's ongoing land use planning efforts.

Presenters:

Margaret Doherty

A Mitigation Planner in FEMA Region VIII, Margaret assists local communities, Tribes, and States with developing natural hazard risk assessments and mitigation plans. Prior to joining FEMA, she spent 15 years in the private and public sectors as a Community Planner working primarily with local governments in Colorado and Virginia.

Anne Kuechenmeister, AICP

A Community Planner and member of the *Resilience Action Partners* team, Anne pairs innovative solutions, sound data, and best practices to support communities as they strive to become safer by mitigating hazards and navigating the challenges of stronger regulations.
